DSN Bootcamp Geospatial Hackathon

Challenge Title: Mapping Nigeria's Digital Divide Through Geospatial Data

Challenge statement: Using the provided Ookla internet performance dataset, participants must integrate at least two relevant external datasets to investigate internet connectivity patterns across Nigeria, identify underserved areas, and develop a geospatial solution that generates actionable insights for digital inclusion.

Key question: Which communities have poor internet connectivity relative to their population, settlement characteristics, and socioeconomic needs, and where should connectivity improvements be prioritized?

Expected deliverables

- An interactive map or geospatial dashboard.
- At least two external datasets integrated with the Ookla data.
- A clear spatial analysis supported by evidence.
- At least three meaningful insights and actionable recommendations.
- Documentation of data sources, methods, and limitations.

Scoring rubric

- Creativity and Innovation: Originality of the approach, uniqueness of the solution, and innovative use of geospatial data.
- Quality of Insights: Ability to uncover meaningful spatial patterns, generate data-driven insights, and provide actionable recommendations.
- Map Accuracy: Correctness of spatial analysis, geographic boundaries, data representation, and map classifications.
- External Data Integration: Relevance, quality, and effective integration of external datasets with the provided Ookla dataset.
- Visualization and Design: Clarity, readability, interactivity, and overall presentation of maps and dashboards.
- Problem-Solving and Impact: Relevance of the solution to real-world connectivity challenges and its potential for practical application.
